

LIV Fertility Center in Mexico Becomes the Only Licensed Clinic for MicroSort® Technologies

The leading fertility clinic in Mexico, [LIV Fertility Center](#), is now the only licensed clinic for [MicroSort® Mexico](#), the gender selection technologies corporation responsible for helping intended parents have a baby of their desired gender during assisted reproductive technologies (ART).

Chicago, IL — December 14, 2017

The leading fertility clinic in Mexico, [LIV Fertility Center](#), is now the licensed clinic for [MicroSort® Mexico](#), the gender selection technologies corporation responsible for helping intended parents have a baby of their desired gender during assisted reproductive technologies (ART).

With the new equipment arriving to the LIV facilities early on Monday — the team at LIV is looking forward to integrating the now in-house family balancing technology with their own fertility services.

“To become the only licensed laboratory to produce [MicroSort®](#) in Mexico, this was a progressive and rewarding step for us here at LIV,” stated Tolga Umar, CEO and Founder of LIV Fertility Center. “We are extremely excited of the hard work that went into acquiring the [MicroSort®](#) brand, and tremendously consumed with offering intended parents across the globe this advanced and successful fertility asset inside our own clinic. We are particularly interested in our continued investment in not only our patient’s futures but also the fertility industry.”

What is [MicroSort®](#) —

The LIV Fertility Center in Puerto Vallarta is among the few centers across the globe to offer internal [MicroSort®](#) technologies. Other locations include North Cyprus, Switzerland and Malaysia.

[MicroSort®](#) is a scientifically proven preconception process that dramatically improves the chances that the baby you conceive will be of the gender you desire. Semen samples typically comprise of an equal amount of sperm carrying the Y chromosome (which will produce a boy), and sperm carrying the X chromosome (which will produce a girl). This method splits the sperm cells based on the chromosome they are carrying. The process results in samples comprising of significantly amplified fractions of sperm that are carrying the desired X or Y chromosome.

It can be used in a wide variety of artificial reproduction techniques, including Intrauterine Insemination (IUI), In Vitro Fertilization (IVF), Intracytoplasmic Sperm Injection (ICSI), and Preimplantation Genetic Screening (PGS) and Preimplantation Genetic Diagnostics (PGD), among others.

Benefits of [MicroSort®](#) for Family Balancing —

What is the benefit of [MicroSort®](#) technologies over PGS/PGD for family balancing? [MicroSort®](#) allows our LIV fertility specialists to choose ONLY the desired embryos — specifically eliminating the discarding

of unused embryos. MicroSort® performed with IVF provides a greater chance for having normal embryos of the desired gender available for transfer and cryopreservation.

As science continues to advance, our team at LIV expects that MicroSort® will play a routine role in the future of family balancing. To learn more about the requirements of family balancing using MicroSort® technologies, the step by step process, and the scientific results — please visit <https://www.microsort.com>.
